Profile

- Master's degree in Computer Science related fields from East China Normal University, with strong computer science fundamentals and solid engineering capabilities; previously interned at SAP and Trip.com.
- Frontend Engineer at Meituan, deeply involved in core business development with hands-on experience in complex ToC systems, transaction flows, and end-to-end feature delivery.

Education

East China Normal University <i>B.Eng. in Computer Science and Technology</i>	Sep 2017 – Jun 2021 <i>Shanghai</i>
East China Normal University <i>M.Eng. in Big Data Technology and Engineering</i>	Sep 2021 – Jun 2024 <i>Shanghai</i>

Work Experience

Meituan <i>Frontend Engineer Core Local Commerce - Healthcare Technology Division</i>	Jul 2024 – Present <i>Shanghai</i>
– Core Business and Transaction Flow Development: Responsible for the development of Meizhigou private-domain live streaming mini-program and Meibo SaaS platform (React18). Participated in the implementation of core systems including contract workflow, group-buying campaigns, and personalized pricing modules, covering key transaction scenarios such as live-stream shelves and product detail pages, supporting cumulative revenue exceeding 1 billion RMB. – High-Concurrency Real-Time Messaging Architecture: Led the reconstruction of the Pike real-time messaging pipeline and personalized pricing system. Designed a global PikeBus event system and request-merging queue with deduplication, debounce batching, and concurrency control mechanisms, supporting live-stream scenarios with peak QPS around 3000 while maintaining stable real-time price synchronization. – AI Engineering and Agent Runtime Practice: Led frontend development of an AI-powered business assistant desktop application for SMB merchants, currently covering more than 200+ merchants. Designed streaming Agent interaction flows and multi-session state management, optimizing high-frequency SSE rendering through event aggregation and frame-level batching to significantly reduce UI lag and redundant re-renders during long conversations.	

Projects

Group-Buying Feature for Private-Domain Live Streaming (WeChat Mini Program / React)	Mar 2024 – Present
– Built the end-to-end C-side transaction flow for the group-buying feature in Meizhigou mini-program, covering live-stream shelves, product detail pages, checkout pages, and WeChat share cards. Designed dynamic rendering logic for multi-state group-buying products and integrated pricing, coupon, and transaction platform parameter chains, enabling successful rollout of the feature from 0 to 1 and increasing group-buying payment conversion rate by approximately 18%.	
Personalized Pricing Reconstruction for Live-Stream Shelves (WeChat Mini Program / Pike / Meituan)	Mar 2024 – Present
– Reconstructed the live-stream pricing pipeline to support real-time personalized pricing and promotions. Refactored the architecture from “Pike pushing full product payloads” to “Pike pushing product IDs + frontend fetching real-time pricing”. Designed a PikeBus event system and request-merging queue with deduplication and concurrency control, supporting peak QPS around 3000 while significantly reducing traffic spikes on upstream pricing services.	
AI Business Assistant for Medical Merchants (Electron / React)	Mar 2026 – Present
– Led development of an AI-powered desktop assistant for SMB merchants, supporting business diagnostics, content marketing, and customer management workflows, currently serving more than 200+ merchants. Designed streaming Agent interaction rendering and multi-session state management, optimizing high-frequency SSE rendering through event aggregation and requestAnimationFrame-based batching, reducing first-response rendering latency by approximately 35%.	

Technical Skills

Frontend Frameworks: Proficient in React and WeChat Mini Program development, experienced with Redux, MobX, and Zustand state management, with hands-on experience in complex ToC transaction systems.

Cross-Platform / Engineering: Familiar with React Native, WeChat Mini Programs, and Electron development; experienced with Vite and Webpack; solid understanding of component-based architecture, modularization, and CI workflows.

AI Engineering: Familiar with LLM fundamentals and Agent paradigms such as ReAct and Plan-and-Execute; experienced with SSE streaming event processing and AI Agent application development.
